

1 First section

This document uses the Palatino-like TeX Gyre Pagella font for the main text and math, and the Optima font for headings. Optima ships as a system font on macOS but is proprietary and is not bundled with TeX Live (including `texlive-full` on Debian); on Linux, substitute URW Classico (CTAN package `classico`), which is a metric-compatible free clone. The line spacing is set to 1.2, and the margins are configured to be slightly less wide than the default. All of this lives in `modern.sty` — this file just loads the style with `\usepackage{modern}`.

$$\int_0^\infty e^{-x^2} dx = \frac{\sqrt{\pi}}{2}$$

1234567890
This is emphasized text.

2 Compiling

This template is built with Lua^ATeX (required for `fontspec` and `unicode-math`) and uses `biblatex` with the Biber backend for the bibliography. From the directory containing `modern.tex`, `modern.sty`, and `references.bib`, run:

```
lualatex modern.tex
biber modern
lualatex modern.tex
lualatex modern.tex
```

The first `lualatex` pass writes the citation data, `biber` compiles the bibliography, and the final two `lualatex` passes resolve cross-references. The equivalent one-liner with `latexmk` is:

```
latexmk -lualatex modern.tex
```

3 Body example

Modern empirical industrial organization emphasizes the structural modeling of markets (Akerberg et al., [2007](#)). The aim is to closely represent the primitive factors and the strategic conduct of agents—on both demand and production sides—that ultimately determine market outcomes. The structural approach is often contrasted with reduced-form methods, which are more agnostic about the underlying economic model and focus on estimating relationships between observed variables (Angrist and Pischke, [2010](#)). Structural models

can be used to conduct counterfactual analysis and to predict the effects of policy changes, while reduced-form models are typically more focused on identifying causal relationships in the data. Nevo (2001) provides a canonical example of the structural approach in the ready-to-eat cereal industry.
